

Oracle APEX

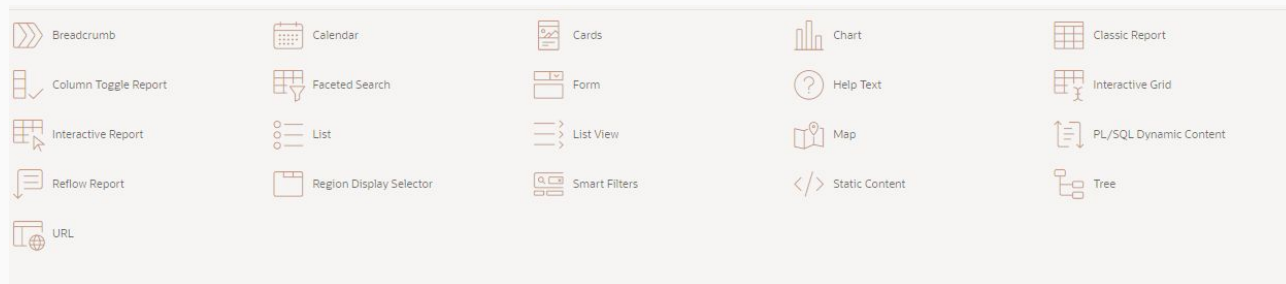

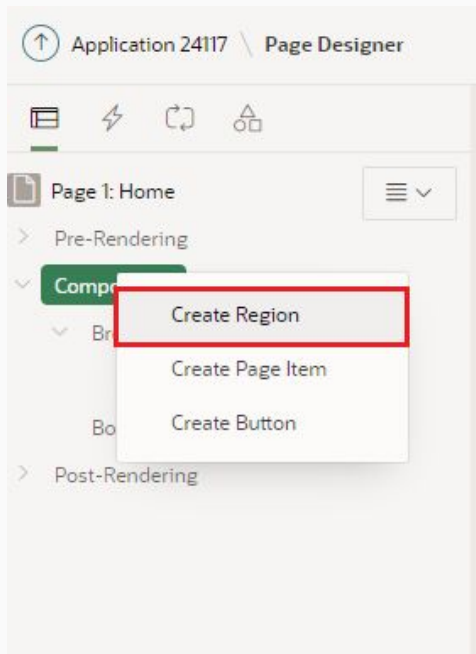

Part 3

Plan

Session 11am – 1pm

1. Create Regions
2. Create Page Items
3. Create Validations
4. Create Dynamic Actions

Create Regions

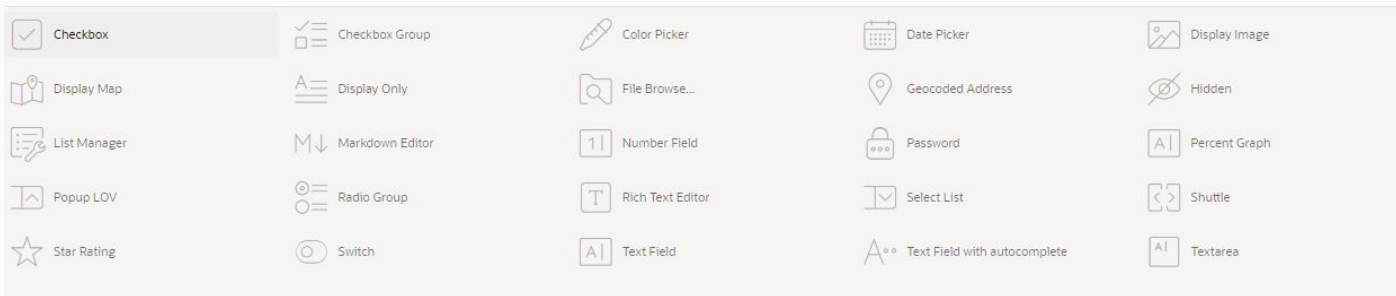

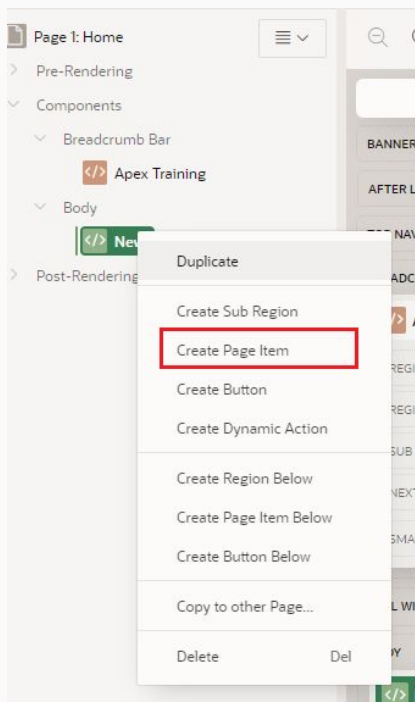

Create Regions

Steps to create region

- Navigate to appropriate Page Definition
- Access the create Region Wizard
 - Tree View - Right click the Regions and select create
- The Create Region Wizard appears
- Select a region type as desired
- Follow the on-screen instructions to create a region.

Create Page Items

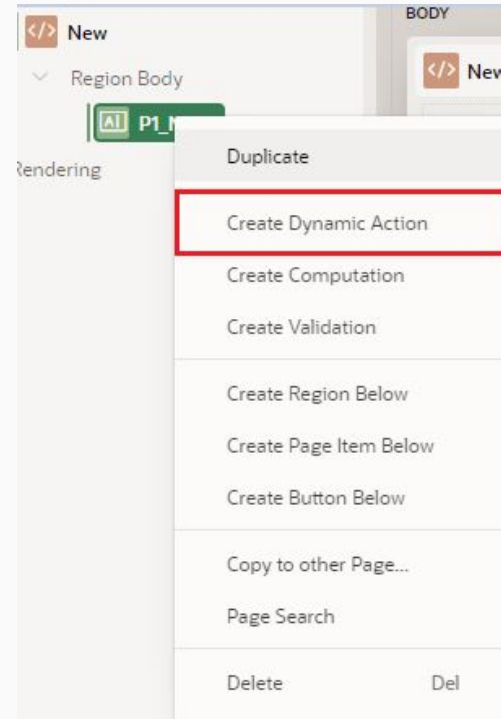

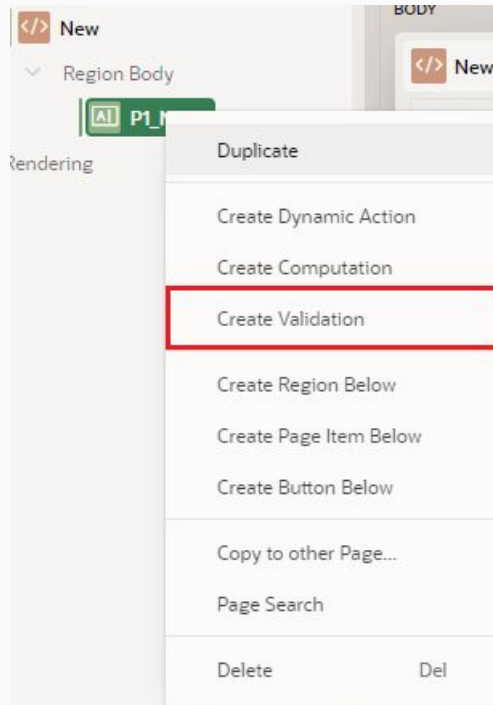

Create Page Items

Steps to create Page Items

- Navigate to appropriate Page Definition.
- If necessary, create a region.
- Under items, click Create icon.
- Select an item type as desired.
- Follow the on-screen instructions to create a Page Item.
- To know more about any type of field, click on the field label. When help is available, the item label changes to red when you pass your cursor over it, and the cursor changes to an arrow and question mark.

Create Validations & Dynamic Actions

Create Validations & Dynamic Actions

Steps to create Validation

- Navigate to the appropriate Page Definition.
- Access the Create Validation Wizard:
 - Tree view - Under Page Processing, right-click Validating and select Create Validation.
- The Create Validation Wizard appears.
- For Validation Level, select Page Item and click Next.
- For Item/Column, select the item to be validated and click Next.
- For Sequence and Name:
 - Sequence - Enter the sequence number for this item.
 - Validation Name - Enter a name for the validation.
 - Error Display Location - Select the display location of the validation error message.
Validation error messages can display on an error page or inline with the submitted page.
Inline validations can display in the notification area (defined as part of the page template) or within the field label.
 - Click Next.

Create Validations & Dynamic Actions

- For Validation:
 - Error Message - Depending upon the validation method, enter the validation or message text that displays if the validation fails.
You can use #LABEL# as placeholder for the label of the associated page item.
 - Always Execute - Determines if validations execute when a page is submitted. Use this attribute with the Execute Validations attribute for buttons or certain page items that submit a page. Option include:
 - Yes - The validation always executes independent of validation settings for buttons or items on a page. Note that defined conditions still apply.
 - No - The validation only executes if the button or item used to submit the page has the Execute Validations attributes set to Yes.
 - Click Next.
- Define conditions that apply to this validation and click Create
